Acme Robotics: Engineering onboarding notes

Acme Robotics builds warehouse picking robots. The engineering team is led by Priya Raman and has twelve engineers.

Decision: the fleet software moves from Python 3.10 to Python 3.13 in November 2026. New services are written in Rust.

All code is reviewed by at least one other engineer before it is merged. Deploys happen on Tuesdays and Thursdays.

Open question: should the team adopt Kubernetes for the robot fleet controllers? Marco suggested trying it on one site first.
